```

5.1.3.12 is_tensor_v

```
template<class T >
constexpr bool ceras::is_tensor_v = is_tensor<T>::value [inline], [constexpr]
```

5.1.3.13 is_value_v

```
template<class T >
constexpr bool ceras::is_value_v = is_value<T>::value [inline], [constexpr]
```

5.1.3.14 is_variable_v

```
template<class T >
constexpr bool ceras::is_variable_v = is_variable<T>::value [inline], [constexpr]
```

5.1.3.15 is_windows_platform

```
constexpr unsigned long ceras::is_windows_platform = 0 [inline], [constexpr]
```

Parameters

ĺ	is_windows_platform	A constexpr helping ceras to select different behaviours. 1 for windows platform and 0
		for non-windows platform.

Example usage:

```
if constexpr( is_windows_platform )
{
```

```
call_windows_method();
}
else
{
    call_linux_method();
}
```

5.1.3.16 learning phase

```
int ceras::learning_phase = 1 [inline]
```

5.1.3.17 Istm

```
auto ceras::lstm [inline]
```

5.1.3.18 make_binary_operator

```
constexpr auto ceras::make_binary_operator [static], [constexpr]
```

Initial value:

5.1.3.19 make_unary_operator

```
constexpr auto ceras::make_unary_operator [static], [constexpr]
```

Initial value:

```
= []( auto const& unary_forward_action, auto const& unary_backward_action, std::string const&
    name="Anonymous Unary Operator", std::function<void()> reset_action = [](){} ) noexcept

{
    return [&unary_forward_action, &unary_backward_action, &name, &reset_action]( auto const& op )
    noexcept
    {
        auto ans = unary_operator{ op, unary_forward_action, unary_backward_action, reset_action };
        ans.name_ = name;
        return ans;
    };
}
```

5.1.3.20 Operator

```
template<typename T >
concept ceras::Operator = is_operator_v<T>
```

5.1.3.21 Place_Holder

```
template<typename T >
concept ceras::Place_Holder = is_place_holder_v<T>
```

5.1.3.22 random_generator

```
std::mt19937 ceras::random_generator {random_seed} [static]
```

5.1.3.23 random_seed

```
unsigned long ceras::random_seed = std::chrono::system_clock::now().time_since_epoch().count()
[static]
```

5.1.3.24 Tensor

```
template<typename T >
concept ceras::Tensor = is_tensor_v<T>
```

5.1.3.25 Value

```
template<typename T >
concept ceras::Value = is_value_v<T>
```

5.1.3.26 Variable

```
template<typename T >
concept ceras::Variable = is_variable_v<T>
```

5.1.3.27 version

```
constexpr unsigned long ceras::version = 20210418UL [inline], [constexpr]
```

5.1.3.28 visible_device

```
int ceras::visible_device = 0 [inline]
```

Public Member Functions

- constexpr view_4d (T *data, unsigned long batch_size, unsigned long row, unsigned long col, unsigned long channel) noexcept
- constexpr auto operator[] (unsigned long index) noexcept
- constexpr auto operator[] (unsigned long index) const noexcept

Public Attributes

T * data_

The pointer to the start position of the 1-D array.

unsigned long batch_size_

The batch size of the 4-D tensor, also the first dimension of the tensor.

• unsigned long row_

The row of the 4-D tensor, also the second dimension of the tensor.

unsigned long col

The column of the 4-D tensor, also the third dimension of the tensor.

· unsigned long channel_

The channel of the 4-D tensor, also the last dimension of the tensor.

6.33.1 Detailed Description

```
template < typename T> struct ceras::view_4d < T>
```

A class viewing a 1-D array as a 4-D tensor. This class is useful when treating an array as a typical 4-D tensor in a neural network, with a shape of [batch_size, row, column, channel].

6.33.2 Constructor & Destructor Documentation

6.33.2.1 view_4d()

Constructor of view_4d

102 Class Documentation

Parameters

data	The raw pointer to the start position of the 1-D array.
batch_size	The first dimension of the 4-D tensor, also for the batch size in the CNN layers.
row	The second dimension of the 4-D tensor, also for the row in the CNN layers.
col	The third dimension of the 4-D tensor, also for the column in the CNN layers.
channel	The last dimension of the 4-D tensor, also for the channel in the CNN layers.

6.33.3 Member Function Documentation

6.33.3.1 operator[]() [1/2]

```
template<typename T >
constexpr auto ceras::view_4d< T >::operator[] (
          unsigned long index ) const [inline], [constexpr], [noexcept]
```

Giving a view_3d interface for operator [].

Parameters

Index The first dimension of the 4-D tensor.

Example usage:

```
std::vector<float> array;
array.resize( 16*8*8*3 );
// operations on 'array'
auto t = view_4d{ array.data(), 16, 8, 8, 3 };
float v0123 = t[0][1][2][3];
```

6.33.3.2 operator[]() [2/2]

```
template<typename T >
constexpr auto ceras::view_4d< T >::operator[] (
          unsigned long index ) [inline], [constexpr], [noexcept]
```

Giving a view_3d interface for operator [].

Parameters

Example usage:

```
std::vector<float> array;
array.resize( 16*8*8*3 );
auto t = view_4d{ array.data(), 16, 8, 8, 3 };
t[0][1][2][3] = 1.0;
```

6.33.4 Member Data Documentation

6.33.4.1 batch_size_

```
template<typename T >
unsigned long ceras::view_4d< T >::batch_size_
```

The batch size of the 4-D tensor, also the first dimension of the tensor.

6.33.4.2 channel

```
template<typename T >
unsigned long ceras::view_4d< T >::channel_
```

The channel of the 4-D tensor, also the last dimension of the tensor.

6.33.4.3 col

```
template<typename T >
unsigned long ceras::view_4d< T >::col_
```

The column of the 4-D tensor, also the third dimension of the tensor.

6.33.4.4 data_

```
template<typename T >
T* ceras::view_4d< T >::data_
```

The pointer to the start position of the 1-D array.

6.33.4.5 row_

```
template<typename T >
unsigned long ceras::view_4d< T >::row_
```

The row of the 4-D tensor, also the second dimension of the tensor.
